THE WHEAT SITUATION
Including Rye

This issue has been prepared with particular reference to the outlook for the wheat and rye crops to be seeded this fall. A separate report on the Summer Outlook for Wheat will not be issued this year.

Summary of wheat and rye outlook for 1938

If wheat growers respond to relatively high prices this year as they have in the past, there is little probability that they will reduce their acreage seeded for harvest in 1938 much below the 81 million acres seeded for this year's crop -- the largest acreage in the history of the country. An acreage of this size with average yields would produce a crop of 950 million bushels. The production this year, as indicated on the basis of August 1 reports, was 890 million bushels. About 650 million bushels are used annually in the United States and, with average yields, this quantity could be produced on about 55 million acres.

Large-scale exports of United States wheat are possible this year, as the result of increased domestic production, small world supplies, and relatively high prices in world markets. The export situation may not be so favorable in 1938. Unless world production in 1938 is again small or export demand increases beyond present expectations, prices of wheat and income to United States wheat growers from the 1938 crop may be expected to be materially lower than during the current marketing season.

With wheat prices high relative to rye prices and about average feed grain supplies in prospect, growers will probably reduce their rye acreage from the 3,960,000 acres harvested this year. Rye production this year, estimated at 52 million bushels, is considerably in excess of usual domestic disappearance, which amounts to about 34 million bushels, and there may be a tendency to return to about the average of 5-years, 1928-32, when 3,315,000 acres were harvested. Such an acreage with average yields per acre would produce a crop of about 40 million bushels, which would be only slightly in excess of usual domestic disappearance. Unless domestic rye yields per acre are low, the world supply small, or demand increased beyond expectations, prices for the 1938 rye crop may be lower than those for the 1937 crop.

Summary of outlook for wheat harvested in 1937

Prospective world wheat supplies for the year beginning July 1, 1937, excluding Soviet Russia and China, are now expected to be about the same as last year. During the past month world production estimates have been revised upward by 50 million bushels and carry-over stocks upward by 10 million bushels. World stocks of old wheat on about July 1, excluding Soviet Russia and China, are now tentatively placed at about 525 million bushels which is about 235 million bushels less than last year. World wheat production, excluding Soviet Russia and China, is now estimated at 3,771 million bushels, which is about 235 million bushels above the 1936 production. The crop in the Northern Hemisphere, excluding Soviet Russia and China, is indicated to be about 3,354 million bushels, or 288 million bushels more than that of last year. On the basis of weather conditions, a production of only about 350 million bushels is indicated for Argentina and Australia, which is about 50 million bushels less than in 1936-37.

World trade in wheat and flour may be 50 to 100 million bushels less

than in 1936-37, and United States exports of wheat, including flour in terms of wheat, may amount to 100 to 125 million bushels. Exports will depend, however, upon final outturns in other surplus producing countries, availability of foreign exchange, and restrictions in consumption in importing countries. Exports will consist mostly of hard red winter wheat, but significant quantities of white wheat from the Pacific Northwest also will be exported.

Higher domestic wheat prices may be expected sometime within the next few months as a result of prospective strengthening of world markets, unless present prospects for a small world production are revised upward materially or European buying does not pick up as much as is now anticipated. However, exports from Soviet Russia, which country has prospects of an increased crop compared with last year may so affect European markets as to retard this possible advance. Temporarily, Liverpool prices may continue to decline until European buying becomes more active, and domestic prices may decline even more than those at Liverpool as a result of some widening of the spread between domestic and Liverpool prices; this widening may be necessary to induce larger exports from the United States.

OUTLOOK FOR 1938 WHEAT^{1/} CROP

BACKGROUND ^{2/}- The acreage seeded to wheat for harvest in 1937, estimated at 81 million acres, was the largest in the history of the country. The acreage seeded for harvest in 1919 was the largest on record up to that time. For the 1919 to 1924 crops, seeded acreage declined from 77 million to 56 million acres. Then it rose to 71 million acres in 1928 and during the 1924-32 period averaged 67 million acres. For the 1934 crop, seeded acreage was brought down to 64 million acres.

^{1/} Rye outlook statement on page 28.

^{2/} See also background statements on pages 5 and 12.

Wheat prices this year are relatively high and the United States crop is likely to be the most valuable since 1927. If growers respond as they have in the past there is little probability that they will reduce their seedings for the 1938 harvest much below the 81 million acres seeded for harvest in 1937. In fact, there is the possibility of a larger total acreage as the result of probable increases in certain areas. Further shifts from corn to wheat seem likely in parts of the hard red winter wheat area, where dry weather has greatly reduced corn yields. Increases in wheat acreage may also occur in parts of the hard red spring wheat area, where seeding conditions were unfavorable this year.

United States production this year, indicated on the basis of August 1 reports at 890 million bushels, is greatly in excess of the 625 to 650 million bushels used annually in the United States for food, feed and seed (table 7), which quantity with average yields could be produced on about 55 million acres.

The 11-bushel yield per seeded acre this year is below the 18-year (1919 to 1936) average of 11.8 bushels (figures 1 and 2). Had abandonment not been unusually heavy this year, over 1 billion bushels would have been produced. With about the same acreage as this year, a yield as low as 8.1 bushels - the record low yield of 1933 - would produce fully enough wheat for usual domestic needs. On the other hand, a yield as large as 15.1 bushels per seeded acre, which was produced in 1924, would result in a crop of about 1,200 million bushels. Average yields would produce a crop of about 950 million bushels.

Production in excess of domestic consumption must either be exported or go to enlarge domestic carry-over stocks. World trade in wheat has declined sharply since 1929, largely as a result of drastic restrictions on imports and increased production in major importing countries. In the early part of this period exports from the United States declined (figure 4) with those from other surplus producing countries. During the past 3 years, small crops in the United States, the result of abnormally small yields per seeded acre, were followed by net importations.

Large-scale exports from the United States are possible this year as the result of the large domestic crop of winter wheat, small world supplies with prospective small crops in Canada, Argentina, and Australia, and relatively high prices in world markets. Unless world production in 1938 is again small or there is a considerable increase in export demand beyond present expectations, the export market for United States wheat in 1938-39 would be much less favorable than this year, stocks would tend to accumulate (table 7 and figure 5), and prices and incomes received by wheat growers for the 1938 crop would be materially below those of the current season.

THE WORLD WHEAT SITUATION

BACKGROUND - Total world supplies of wheat, excluding those of China and including only net exports from Soviet Russia, averaged 4,100 million bushels for the 5 years, 1923-24 to 1927-28, increased to 5,013 million bushels in 1933-34, then declined sharply as a result of successive years of small production and increased world demand. These supplies for 1936-37 are estimated at 4,303 million bushels compared with 4,524 million bushels for 1935-36 and 4,711 million bushels for 1934-35.

World market prices of wheat have been moving steadily upward since the spring of 1933, reflecting higher world commodity price levels, four successive below average harvests in North America and the 1935-36 short Southern Hemisphere crop. World prices during 1936-37 advanced sharply as a result of increased demand and the smallest supplies in recent years.

World wheat crop prospects

The world production of wheat in 1937-38 excluding Soviet Russia and China, is now estimated at 3,771 million bushels, or 7 percent above the estimate of last year and 3 percent above the average production of the past 5 years (table 1). The present estimate shows an increase of about 50 million bushels over the July estimate, which is largely accounted for by increases in the estimates for the United States, Italy, Rumania, and India. Upward revisions for these and other countries more than offset decreases in forecasts since last month for Canada, Argentina, and Australia.

In Canada the unfavorable conditions previously reported, continued through July. On July 31 the condition of the spring wheat crop was only 35 percent of the long-time average, compared with 51 percent on June 30, 1937, and 45 percent on July 31, 1936. The July 31 condition figure for spring wheat is the lowest in 30 years. The fall wheat crop in Ontario is estimated at 17,247,000 bushels, which represents an increase of about 5 million bushels over the small crop of 1936. The wheat crops have matured rapidly and harvesting is now under way in all parts of Canada. The 1937 season probably will equal the record for earliness established a year ago. In Manitoba rains caused considerable lodging in the southern part of the Province. Some good yields are being obtained but rust damage has lowered grades and will cause further losses to the late crops. In Saskatchewan, wheat yields will be low, at best, with a great part of the acreage yielding nothing but feed. In Alberta variable prospects prevail. Yields will be below average but fairly good commercial crops are in prospect over much of the Province. Present conditions indicate a total crop in Canada of only about 165 million bushels.

A wheat crop of about 1,530 million bushels, for Europe excluding Soviet Russia, now seems probable. This is about 45 million bushels, or

3 percent larger than the small 1936 production. It is, however, 3 percent below the average production for the past 5 years. An increase of about 40 million bushels over the July estimate is caused by marked increases in the estimates for Italy and Rumania. The official estimate of 37 million bushels for Greece seems out of line with acreage and condition figures and the more conservative trade estimate of 27 million bushels, which is accepted by the Belgrade office of the Bureau as the better estimate, has been used in the production table. The total of the estimates for the four Danubian countries shows a decrease of 30 million bushels from the large crop of last year but is still above average. Smaller crops for Hungary and Yugoslavia account for the decrease which is the result of reduced yields since the acreage is about the same as last year.

Conditions in Soviet Russia are said to be very favorable and a good harvest is expected. Harvesting is in progress in most regions but on July 25 was considerably behind a year ago. Conditions point to high harvesting losses.

In North Africa production is estimated to be 2 percent above last month's estimate, as a result of an upward revision in the estimate for Algeria. The current estimate is 20 percent above that of 1936.

Present estimates in Asia, excluding China, indicate an increase of 4 percent over last year in contrast to a decrease reported last month. This change is caused by large upward revisions in the estimates for Turkey and India. The present estimate exceeds any recorded production for Asia.

In Argentina general rains are needed over the entire country. The drought has held up seeding in some regions and has delayed germination of the grain already planted. In the Buenos Aires region, however, which comprises over half of the total wheat acreage, the condition is reported to be good and a considerable increase in acreage compensates for decreased acreages in the drought areas. The general opinion is, that, in spite of adverse seeding conditions, there will be an increased acreage of perhaps around 7 percent or more, compared with the 1936 acreage. If, however, the drought should persist, any increase in acreage would undoubtedly be offset by lighter yields. Moisture to date, on the basis of past rainfall and yield relationships, indicates a production of around 210 million bushels.

In most regions of Australia rainfall is reported to be deficient. The wheat crop is approaching the critical period in its development and the outlook will be serious if good rains are not received before the end of August. The crop is later than usual and present conditions point to a crop of only about 140 million bushels.

- 8/ Estimate of the Belgrade office of the Bureau.

World wheat stocks and trade

World stocks of old crop wheat, excluding those of Soviet Russia and China, on about July 1 are now tentatively placed at 525 million bushels, which is about 235 million bushels less than stocks last year and the lowest since 1924. It is estimated that United States stocks were 39 million bushels less, Canadian 85 million less, and Argentine 13 million less than a year ago. Stocks in European countries also are at the lowest levels in many years. While it is still too early to have complete reports from European countries, the evidence at hand indicates that stocks are perhaps 85 million bushels smaller than a year ago.

The table accompanying figure 3 shows estimated world stocks of wheat beginning with 1922, together with other supply figures. The table also shows apparent world disappearance of wheat and average British Parcels price per bushel.

World trade in wheat in 1937-38, on the basis of present prospects may be between 50 and 100 million bushels less than for the year ended June 30, 1937, when an estimated 450 million bushels were taken by European importing countries^{3/} and about 125 million bushels by non-European countries, or a total of about 575 million bushels. The comparable total for the year before was 494 million bushels, and for 2 years earlier, 517 million bushels. On the basis of present crop estimates and a reasonable minimum carry-over, the following quantities, in million bushels, appear available for export: Argentina 110, Australia 85, Danubian countries 70, Canada 60, North Africa and miscellaneous countries 25, making a total outside of the United States and Soviet Russia of 325 million bushels.

Exports this year will probably depend to a greater extent than usual on availability of foreign exchange between countries and reduction in demand. European importing countries will undoubtedly again give preference to Danubian wheat, which trade is largely on a barter or agreement basis^{4/}. Early estimates, however, will probably be most affected by changes in production estimates. The figures for the Southern Hemisphere countries are subject to considerable change before the time of their harvest which takes place in November through January. Present prospective supplies in the United States indicate a surplus available for export of about 200 million bushels, but it is probable that they will be confined largely to hard red winter wheat and be considerably less than this figure - perhaps 100 to 125 million bushels.

Because of the small world wheat supplies this year, export possibilities of Soviet Russia are of special concern. The figure used in the table was considered nominally at 30 million bushels. Resumption of wheat shipments from the Union in small quantities at the beginning of August may presage exports on a scale similar to 1935-36 and 1933-34 when net exports amounted to 29 and 34

^{3/} Excludes Danubian countries, Soviet Russia, Poland and Czechoslovakia.

^{4/} Early indications of import demand by the United Kingdom, Germany, France, Italy, Belgium, Spain and Portugal were discussed in "The Wheat Situation" for July, pages 8-9.

million bushels respectively. The prospects for the 1937 grain crops in the Union are favorable and although heavy harvesting losses are indicated, the outturn will undoubtedly be larger than in 1936. In that year a serious drought affected grain crops adversely over large areas, and just as after the drought year of 1934, exports during the 1936-37 season were insignificant.

The export outlook in the case of the Soviet Union always has had a considerable element of uncertainty, since Soviet grain exports depend not only upon the availability of an export surplus but also upon the policy of the Government which has a monopoly of all export and import trade. The apparently good 1936 crop and a high level of prices on the international wheat market favor fairly large exports. On the other hand, the Government will probably desire to replenish the grain reserves established for military and other contingencies which were doubtless reduced during the past year by the need of extending assistance in the drought-stricken areas. The Soviet Union is also under no such pressure to expand its exports as it was during the period of the First Five Year Plan. While it is true that there was a small adverse balance of trade during the first half of 1937, this was apparently due to a considerable extent to credit purchases. Moreover, gold production has been on the increase in the Soviet Union, which was able during the months March to June to ship nearly \$150,000,000 worth of gold to Great Britain, i.e., an amount exceeding, several times over, the whole adverse balance of trade. Judging from the experience of recent years of good crops (in 1935 and 1933), Soviet wheat exports are not likely to exceed 30 to 40 million bushels. Nevertheless, the possibility of the Government attempting somewhat larger exports, particularly if the crop outturn should exceed that of 1935, or deciding to export less, must not be overlooked. Tables 10 to 12 show figures on movement of wheat in international trade in 1936-37 compared with other recent years.

Foreign wheat prices 5/

Liverpool and Winnipeg prices have declined sharply since the middle of July as the result of very heavy winter wheat marketing in the United States, slow demand, and increased shipments from Danubian countries, besides early offers and sales of Russian wheat to Europe. For the week ended August 14 the October futures at Liverpool averaged \$1.28 compared with \$1.44 for the week ended July 17, while at Winnipeg it declined from \$1.43 to \$1.28. Losses in both markets were about the same. Prices at Buenos Aires remained above an export basis to Europe as a result of limited remaining wheat supplies. Table 2 shows prices of futures at Liverpool, Winnipeg, and Buenos Aires, together with prices at Chicago, Kansas City and Minneapolis for the current season by weeks.

5/ Domestic prices are discussed on page 15.

THE DOMESTIC WHEAT SITUATION

BACKGROUND - The carryover of wheat in the United States for the 5-year period (1924-28) averaged about 115 million bushels. Stocks which began to accumulate in 1929 reached the record peak of 378 million bushels in 1933. Four small wheat crops since that time, however, reduced stocks to 142 million bushels by July 1, 1936.

Domestic wheat prices since the spring of 1933 have been unusually high relative to world market prices as a result of four small domestic crops caused largely by abnormally low yields per acre. During 1936-37 both world and domestic prices advanced sharply as a result of increased demand and the smallest supplies in recent years.

Domestic wheat prospects

A crop of all wheat of 890 million bushels in 1937 is indicated by August 1 reports on average yield per acre of winter wheat and condition of spring wheat. The final estimate of all wheat in 1936 was 626 million bushels and the 5-year (1928-32) average production was 865 million bushels. Yields of both winter and spring wheat were reduced in a number of States from black stem rust and in some places from high temperatures that caused premature ripening. This not only reduced yields but also the average test weight per measured bushel, the net result of which will be a lower output of flour per bushel of wheat. Reports from crop correspondents and estimates of the Crop Reporting Board are in terms of 60-pound bushels.

The preliminary estimate of winter wheat is 688 million bushels compared with 519 million bushels in 1936 and 623 million bushels, the 5-year (1928-32) average. The average yield per acre is 14.6 bushels compared with 13.8 bushels in 1936 and 15.2 bushels, the 10-year (1923-32) average. This represents an increase of 24 million bushels compared with the indicated production a month ago. The crop turned out somewhat better in Kansas, Nebraska, and Missouri, and improvements over July 1 prospects were also noted in several of the Western States and in Kentucky, Pennsylvania, and New York. Reductions in winter wheat yields as compared with July 1 prospects, largely due to black stem rust, were shown in the Corn Belt States east of the Missouri River, especially Indiana, Ohio, and Michigan. South Dakota, Minnesota, Wisconsin and Iowa also showed somewhat lower production.

Production of all spring wheat indicated on August 1, 1937, at 202 million bushels shows a decline of 7.5 percent since July 1 as a result of drought, heat, grasshoppers and rust which did varying amounts of damage in North Dakota and South Dakota and Montana where the largest declines in prospective yields occurred. Rust damage was extremely spotted and varied with the variety of wheat, the time of seeding and weather conditions since infection. On the other hand, prospects held up well in Minnesota and improved in the Pacific Northwest States where crops well above the harvests of both 1936 and the 5-year (1928-32) average are now expected.

July 1 stocks

Stocks of wheat in the United States as of July 1 comparable with the series which covers the period beginning with 1923-24 (table 7) are estimated at 103 million bushels. This figure is made up of stocks on farms, in country elevators and mills, in cities (commercial stocks) and in merchant mills and elevators. Stocks of old wheat on farms, July 1, 1937, were estimated at 22 million bushels and in interior mills and elevators at 12 million bushels. Total stocks in cities (commercial) were estimated at 25 million bushels and in merchant mills and elevators including stored for others at 53 million bushels.

Stocks of old wheat on July 1 on the basis of these figures were estimated by the Bureau at approximately 91 million bushels. While stocks on farms and in interior elevators and mills consist only of old-crop wheat, it is estimated that there were 7 million bushels of new crop wheat in the commercial stocks figure as of July 1 and about 5 million bushels in the figure for merchant mills and elevators, which item included grain stored for others as well as grain owned by mills. The July 1, 1936, estimate for commercial stocks included 4,581,000 bushels of new wheat. Ordinarily, new wheat does not get into commercial stocks or merchant mills in significant quantities by July 1, but stocks of old wheat were so low this year that new wheat was readily purchased by mills and city elevators.

Stocks on farms and in interior elevators and mills and in commercial centers were estimated by the Bureau. The figures on merchant mill stocks as released by the Bureau of the Census, Department of Commerce, were raised to represent stocks in all merchant mills.

Table 7 shows supplies and distribution of wheat, 1923-24 to date. (It will be observed that the carryover for 1936 has been changed from 138 million bushels previously published to 142 million bushels. An item of 4 million bushels of new wheat in commercial stocks not included last year has now been added to make a consistent series, which in every year is the sum of old grain on farms and in interior mills and elevators and total grain in city and merchant mill stocks).

Prospective supplies and distribution

An analysis of prospective wheat supplies and distribution by classes for 1937-38, on the basis of prospects at this time, indicates that supplies of hard red spring and durum wheat are ample to take care of the prospective requirements, and that there will be surplus supplies of hard and soft red winter and white wheats over domestic requirements.

Table 3 shows the estimated July 1 stocks, current crop estimates and estimated prospective utilization, by classes. These figures are in terms of 60-pound wheat and, therefore, take into consideration that hard red spring wheat is running light in test weight. Some substitution of heavy hard red winter wheat may be expected, which substitution is also taken into consideration in computing the table. The actual utilization by classes will depend, of course, on a number of factors, two of which are the relative prices of the different classes of wheat, and the prices of wheat relative to feed grain prices and supplies in the various sections of the country, especially during

the period prior to the harvesting of the new corn crop. If exports amount to around 120 million bushels, which seems reasonable on the basis of prospective supplies in other surplus producing countries and an early appraisal of European demand, perhaps 85 million bushels of it would be of hard red winter wheat. Larger exports of this type of wheat would reduce supplies available for domestic needs below a desirable minimum.

1/ An estimated 12 million bushels of new hard red winter wheat not included.

2/ Includes flour in terms of wheat.

United States hard red winter wheat is a semi-strong bread flour wheat and can be substituted by millers in importing countries for short supplies of strong Canadian^{and} semi-strong wheats. As a result it is to be expected that importing countries will take about all the hard red winter wheat they can obtain from us this year. Moreover, because of small world wheat supplies in prospect, it is likely that more than the usual demand for soft wheats may be expected. Most of the wheat produced in Europe and Australia consists of soft varieties, and semi-strong and "strong" wheats such as produced in Canada, Argentina and the southwestern United States area needed to produce a high quality bread flour.

Table 8 shows estimated supply and distribution of wheat by classes, 1931-32 to date.

Domestic wheat prices

Wheat prices in domestic futures markets, influenced by the same factors as prices in Liverpool ^{6/} declined sharply since the middle of July as the result of very heavy marketings of wheat in the United States, less urgent demand from domestic millers, and increased shipments from Danubian countries, besides early offers and sales of Russian wheat to Europe. Table 2 shows futures prices at Chicago, Kansas City, and Minneapolis.

Cash prices in domestic markets declined with futures prices. For the week ended August 14 Chicago September futures and No. 2 Hard Red Winter at Kansas City and No. 2 Red at St. Louis were about 14 cents lower than for the week ended July 17; No. 1 Dark Northern Spring at Minneapolis averaged 16 cents lower (table 6). While domestic prices are sufficiently under those in importing countries for exports to take place, past relationships of spreads and exports indicate that a wider spread will be necessary for large volume exports. Table 4 shows cash prices in important domestic markets, and table 5 gives the price spreads between domestic wheat prices and prices at Winnipeg and Liverpool.

^{6/} Foreign wheat prices are discussed on page 10.

Winter Wheat: Acreage Seeded, Yield Per Acre, and Production, 1919 to Date

U.S. DEPARTMENT OF AGRICULTURE

* PRELIMINARY

NEG. 31697-D BUREAU OF AGRICULTURAL ECONOMICS

FIGURE 2.— THERE WAS LITTLE CHANGE IN WINTER WHEAT ACREAGE SEEDED FOR THE 1929 TO 1934 HARVESTS. SEEDINGS FOR THE 1936 HARVEST, HOWEVER, WERE INCREASED TO THE SECOND LARGEST AND THOSE FOR THIS YEAR TO THE LARGEST IN HISTORY. SMALL PRODUCTION IN THE PAST 6 YEARS WAS THE RESULT OF LOW YIELDS PER ACRE CAUSED CHIEFLY BY DROUGHT.

Winter Wheat: Acreage seeded, yield per acre, and production, 1919 to date

Year of harvest	Acreage seeded	Yield per acre	Production
	1,000 acres	Bushels	bushels
1919	51,391	14.6	748,460

3/ Preliminary.

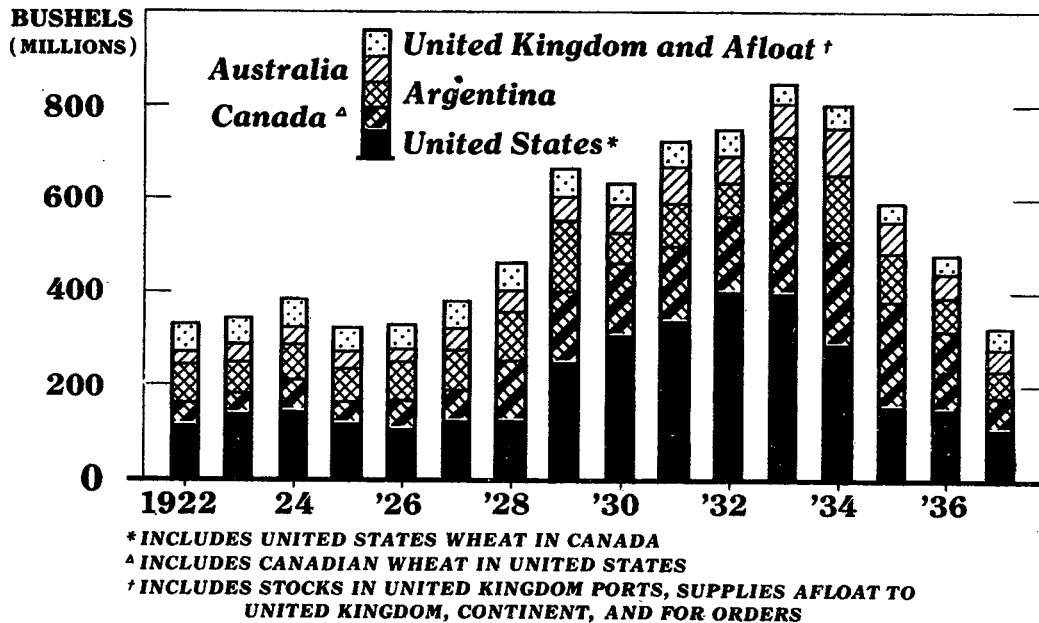

Wheat: Average Price at Liverpool and Kansas City, and Net Exports From U.S., 1922 to Date^A

U.S. DEPARTMENT OF AGRICULTURE NEG. 3132 0 BUREAU OF AGRICULTURAL ECONOMICS

FIGURE 4.- WHEAT PRICES IN THE UNITED STATES, AFTER HAVING BEEN MATERIALLY ABOVE WORLD PRICES SINCE THE BEGINNING OF 1933, HAVE NOW ADJUSTED TO AN EXPORT BASIS. HIGH PRICES RELATIVE TO LIVERPOOL WERE LARGELY THE RESULT OF 4 SUCCESSIVE YEARS OF VERY SMALL PRODUCTION IN THE UNITED STATES. THE GENERAL TREND IN WHEAT EXPORTS DURING RECENT YEARS HAS BEEN DOWNWARD, BUT SMALL SUPPLIES IN OTHER COUNTRIES MAY CAUSE EXPORTS IN 1937-38 TO BE RELATIVELY LARGE.

Wheat: Stocks in Major Exporting Countries and Afloat, as of July 1, 1922 to Date

U. S. DEPARTMENT OF AGRICULTURE

NEG. 21335-B BUREAU OF AGRICULTURAL ECONOMICS

FIGURE 5.- AFTER REACHING RECORD SIZE IN 1933 STOCKS OF WHEAT IN MAJOR EXPORTING COUNTRIES AND AFLOAT HAVE BEEN REDUCED TO ABOUT THE LEVEL WHICH EXISTED FROM 1922 TO 1927. THIS REDUCTION HAS BEEN LARGELY THE RESULT OF SMALL WORLD CROPS AND INCREASED DEMAND. THE LARGE STOCKS WHICH ACCUMULATED FROM 1929 TO 1933 WERE PARTLY THE RESULT OF INCREASED PRODUCTION, BUT THEY ALSO RESULTED FROM MEASURES WHICH IMPORTING COUNTRIES TOOK TO REDUCE THEIR WHEAT IMPORTS, AND THE EFFECT ON DEMAND OF THE WORLD-WIDE DEPRESSION.

Wheat: Stocks in major exporting countries and afloat, as of about July 1, 1922 to date

Year	United States : grain ^{1/}	Canadian : grain ^{2/}	Argentina	Australia	United : Kingdom ^{3/}	Total
	Million bush.	Million bush.	Million bush.	Million bush.	Million bush.	Million bush.

Tables to accompany Chart No. 31320-B.

OUTLOOK FOR THE 1938 RYE CROP

BACKGROUND.- During the past 10 years rye acreage has remained above pre-war levels due largely to the expansion of rye production into the sub-humid areas of the spring wheat belt. In 1933 and 1934 the harvested acreage was greatly reduced because of heavy abandonment. In both of these years and in 1936 production was greatly reduced also because of unusually low yields. In 1935 and 1937, production was large not only because the acreage was large but because yields per acre were above average.

With wheat prices high relative to rye prices and prospective feed supplies above average, growers will probably reduce their rye acreage from that of this year, when 3,960 thousand acres were harvested. For the 5 years (1928-32) the harvested area averaged 3,315 thousand acres. It is not probable, however, that the acreage next year will decline to this average. An average acreage, with average (1912-36) yields of 12.1 bushels, would produce a crop of about 40 million bushels or about 5 million bushels in excess of disappearance under "normal" conditions. If the acreage is larger than average, and yields per acre are average, the excess of supply over disappearance would be expected to be increased proportionately, unless prices and supplies of rye relative to other feed grains induced increased feeding. While average yields have been used in these computations, it is well to recognize variations in yields which are very important in determining production (figure 6).

Unless domestic rye yields per acre are low, world supply small, or demand is increased beyond expectations, prices for the 1938 rye crop may be lower than those received for the 1937 crop.

THE RYE SITUATION IN 1937-38

The preliminary estimate of the 1937 rye production is 52 million bushels and the carryover, computed as the total of June 1 farm stocks and July 1 commercial stocks, is 6 million bushels, making a total supply of 58 million bushels. It now seems reasonable to expect that about 7.5 million bushels may be used for flour milling, about 11.5 million bushels for distilling and, if seed and feed amounts to about 15 million bushels, total disappearance would total about 34 million bushels. The amount used for feed varies considerably from year to year, but with about normal feed grain supplies this year, rye feeding would not be expected to be unusually heavy. On the basis of these figures and a normal carryover of 8 to 10 million bushels, around 15 million bushels would be available for export.

With our exports of rye drastically reduced since 1927 and 1928, mostly because of small crops, but also because of ample supplies or marketing restrictions in European importing countries, it is difficult to appraise the present export possibilities. While the opportunity for finding an export market for our rye appears favorable when considered from the point of view of European supplies, which are definitely below normal, imports by European countries may be held to the minimum permitted by the supply situation.

Table 13 shows the relative importance of the various important exporting and importing rye countries. It will be observed that the United States ranked first as an exporter in the period 1925 to 1929, since which time Poland has taken the lead.

The situation is again reversed this year with the United States having a substantial surplus and Poland having so small a production as to cause that country to be close to a deficit basis. Only in the event that the potato and beet crops turn out satisfactorily would exports from Poland be expected. Some small surplus supplies of rye may be available this year from the Baltic countries which appear to be harvesting considerably better crops than in 1936. Because of the very short rye crop in Germany, that country is attempting to meet the deficit by forbidding the use of this grain for stock feed and by making other imported feeds available. Direct purchases by Germany of United States rye, however, are likely to be of little consequence.

A European rye crop somewhat below that of last year now seems definitely in prospect (table 14). For the 16 European countries for which estimates have been received, a crop of 684,368,000 bushels, or 56 million bushels less than the small crop of 1936 is indicated. The total of the 16 countries constitutes 85 percent of the July estimate of total European production, issued by the Berlin Office of the Bureau of Agricultural Economics. The decrease in this year's crop is accounted for almost wholly by the decreased production in Germany and in Poland (the most important European exporter in recent years), decreases of 39 million bushels and 26 million bushels, respectively, compared with last year. The rye and meslin crop in the Danubian countries is somewhat smaller than the 1936 crop, being estimated by the Belgrade Office of the Bureau as 64 million bushels this year compared with 68 million bushels a year ago.

In Canada the production of winter rye is estimated at 4,276,000 bushels compared with last year's short crop of 3,042,000 bushels.

1/ Total imports minus total exports (domestic plus foreign) (1 bbl. of rye flour = 6 bushels of rye).

2/ Includes stocks on farms as of June 1 (available only beginning with 1935 and only for June 1) plus commercial stocks as of July 1.

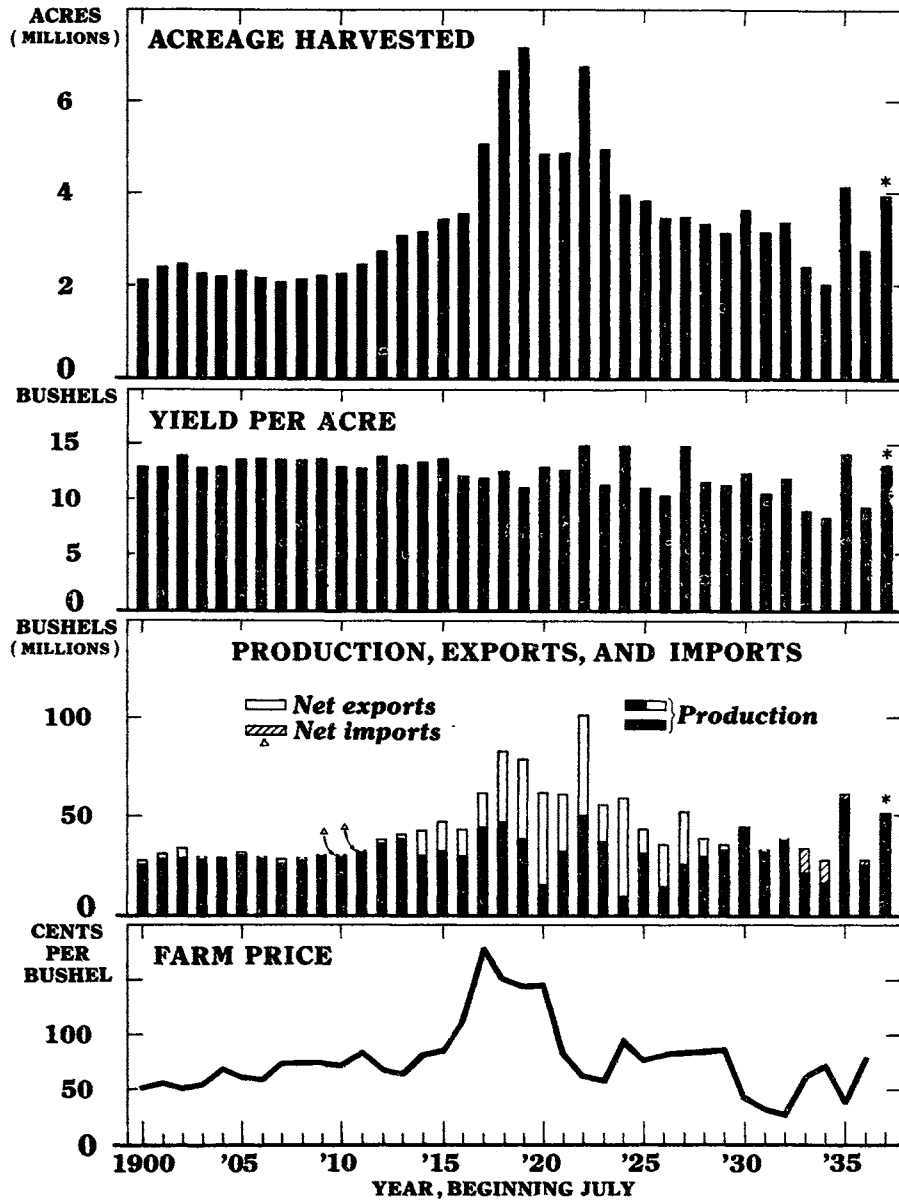

3/ Net exports.

4/ Net imports for 11 months (July - May).

5/ Preliminary figure published December 1936.

6/ July 1 indications.

Rye: Acreage, Yield Per Acre, Production, Exports and Imports, and Farm Price

U. S. DEPARTMENT OF AGRICULTURE

*AUG. 1 ESTIMATE

NEG. 20705-B BUREAU OF AGRICULTURAL ECONOMICS

FIGURE 6.- RYE PRODUCTION INCREASED PRIOR TO 1920 LARGELY AS THE RESULT OF EXPANSION OF RYE ACREAGE INTO THE SUB-HUMID AREAS OF THE SPRING WHEAT AREA. SINCE THE WAR THERE HAS BEEN A TENDENCY FOR ACREAGE TO FLUCTUATE NEAR THE 1928-32 LEVEL, ALTHOUGH IN RECENT YEARS IT HAS VARIED CONSIDERABLY. SMALL CROPS IN 1933, 1934, AND 1936, LARGELY THE RESULT OF HEAVY ABANDONMENT AND UNUSUALLY LOW YIELDS, CAUSED SUPPLIES IN THESE 3 YEARS TO BE REDUCED BELOW DOMESTIC REQUIREMENTS. THE ACREAGE HARVESTED IN 1937 WAS AGAIN LARGE AND YIELDS WERE ABOVE AVERAGE.
